Empoli

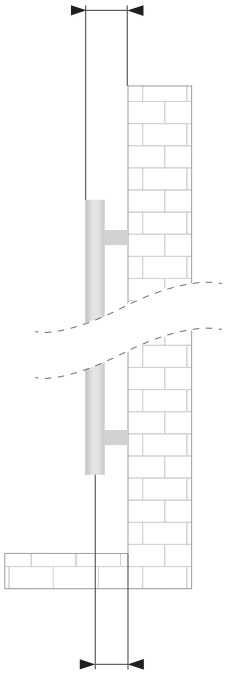
Technical sheet

lazzarini

h 1800

	straight
Material	carbon steel
Pipes - mm	70x11x1,5
Collectors - Ø	35x1,5
Connections	6x1/2' *
Wall fixings	4
Max pressure	4 bar
Max temperature	120 °C
Paint	epoxypolyester powder
Packaging	nylon bag + styrofoam protections + carton box
*** air bleeding valve connection, included**	

85 mm



55 mm

Standard equipment: 1 kit wall fixing brackets - 1 air bleeding valve - 3 blind plugs

White RAL 9016

Our radiators are tested in qualified laboratories according to EN-442 regulations which determine the ouput value by fixing the ΔT at 50° C. ΔT is the difference between the average temperature of the water inside the radiator and the room temperature. The formula is: $(((T_1+T_2)/2)-T_3)$.
Ex.: ((75+65/2)-20)= 50° C. For output values with a different ΔT use the following formula: $\phi_x = \phi_{\Delta T50} * (\Delta T_x/50)^n$.
See calculation example of the output at ΔT 60° of article 383856: $419*(60/50)^{1,31404}= 533$.
Output values in kcal/h = watt x 0,85984. Output values in btu = watt x 3,412.

LEGEND

T_1 = supply temperature - T_2= return temperature - T_3= room temperature.
ϕ_x = output to be calculated - $\phi_{\Delta T50}$ = output at ΔT 50° C (table) - ΔT_x = ΔT value to be calculated - ^{n} = exponent "n" (table).
